- CONCLUSION

OBJECTIVE

The objective of this module is to design and develop a dynamic pricing system using Power BI. The system calculates recommended room prices based on seasonal demand, pricing adjustments, and occupancy sensitivity. Additionally, it integrates ancillary revenue analysis to support data-driven decision-making.

DATA TABLES USED

The following tables were used in this module:

- **Bookings:** Contains booking details such as room rate, booking ID, and customer information.
- **Ancillary_Transactions:** Includes additional services like spa, dining, and service revenue.
- **Date**: Provides seasonality, month, and time-related attributes.
- **Customer:** Contains customer-related information.

These tables were connected using appropriate relationships to enable accurate analysis.

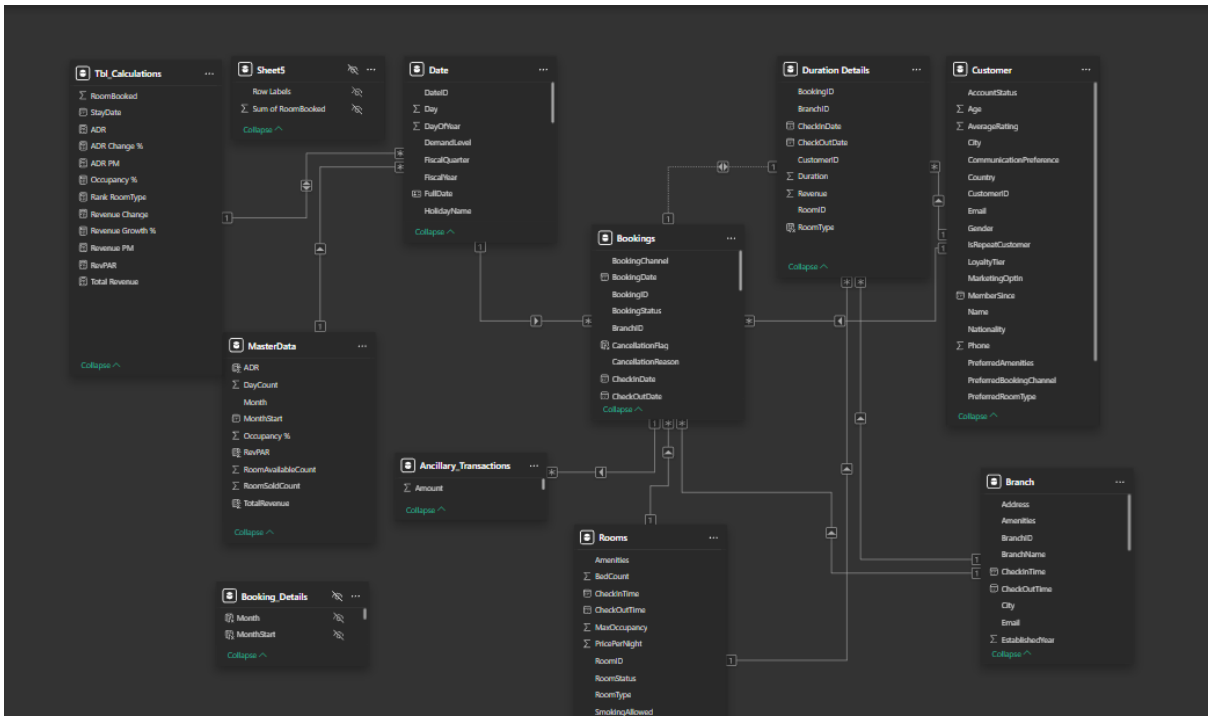
DATA MODEL & RELATIONSHIPS

A star schema data model was implemented where the Bookings table acts as the central fact table. The Ancillary_Transactions table is connected to Bookings using BookingID in a many-to-one relationship.

The Date and Customer tables are linked to Bookings to enable proper filtering and avoid ambiguity. Single-direction filtering is used to maintain model efficiency.



CREATED MEASURES

- **DADR (Daily Average Room Rate)**
  DADR is calculated as the average room rate from the Bookings table. It serves as the base value for dynamic pricing calculations.

```
DADR = AVERAGE(Bookings[RoomRate])
```

- **Recommended Price**

  The Recommended Price measure dynamically calculates room pricing based on multiple factors including base ADR, seasonal adjustments, price uplift, and occupancy sensitivity.

  Seasonal adjustments are applied using the Season column from the Date table, allowing prices to vary depending on demand conditions.

```
Recommended Price =
VAR BaseADR = [DADR]

VAR SeasonAdj =
    SWITCH(
        SELECTEDVALUE('Date'[Season]),
        "Winter Peak", 0.15,
        "Spring", 0.05,
        "Summer", -0.05,
        "Monsoon", -0.10,
        0
    )

VAR Uplift = [Price Uplift % Value]
VAR Elasticity = [Occupancy Sensitivity Value]

RETURN
    BaseADR * (1 + SeasonAdj + Uplift) * Elasticity
```

WHAT-IF PARAMETERS

- **Price Uplift Parameter**

  A What-if parameter named Price Uplift (%) was created to allow users to increase or decrease room pricing dynamically. This parameter enables simulation of different pricing strategies.

```
Price Uplift % = GENERATESERIES(-0.2, 0.2, 0.01)
```

- **Occupancy Sensitivity Parameter**

  Occupancy Sensitivity parameter controls how aggressively pricing reacts to demand. Higher values increase pricing responsiveness, while lower values maintain conservative pricing.

```
Occupancy Sensitivity = GENERATESERIES(0.8, 1.2, 0.01)
```

VISUALIZATIONS CREATED

- **Recommended Price Card**

  A KPI card was created to display the dynamically calculated recommended room price. This reflects real-time changes based on user inputs and seasonal conditions.

- **Pricing Matrix**

  A matrix visual was used to display recommended pricing across different room types and seasons. Conditional formatting was applied to highlight high and low pricing values for better interpretation.

Dynamic Pricing by Room Type & Season

RoomType	Autumn Peak	Monsoon	Spring	Summer	Winter Peak	**Total**

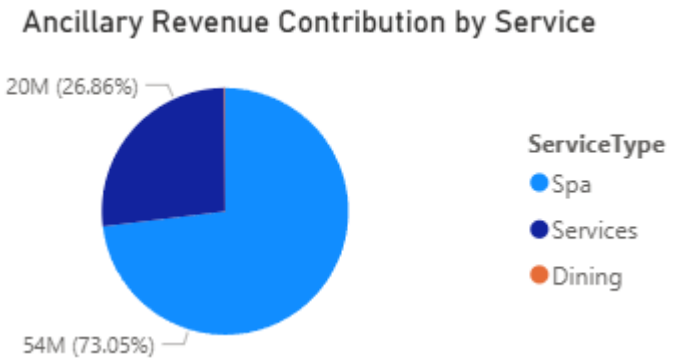
Total	**4,835.67**	**4,332.27**	**5,133.15**	**4,617.68**	**5,794.13**	**4,887.32**

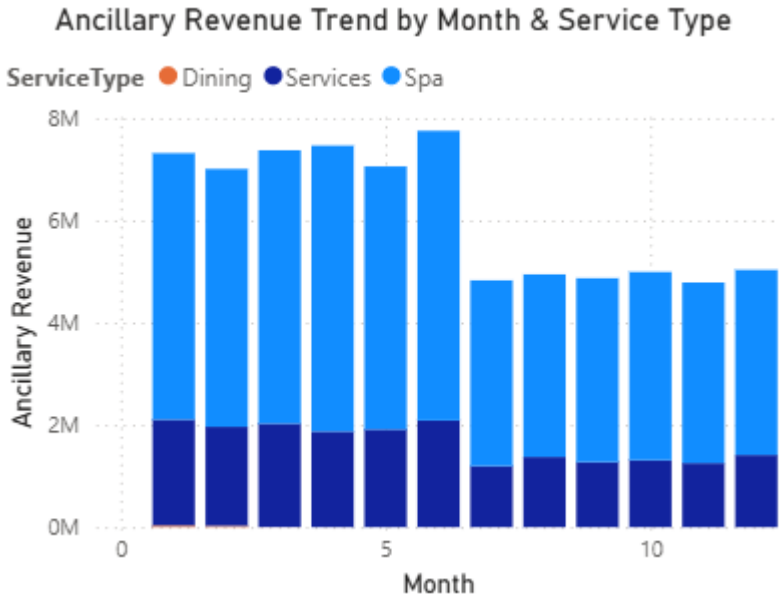
- **Ancillary Revenue Pie Chart**

  A pie chart was created to show the contribution of different service types such as spa, dining, and other services to total ancillary revenue.



- **Revenue Trend Chart**

  A stacked column chart was used to analyze monthly trends in ancillary revenue across different service categories.



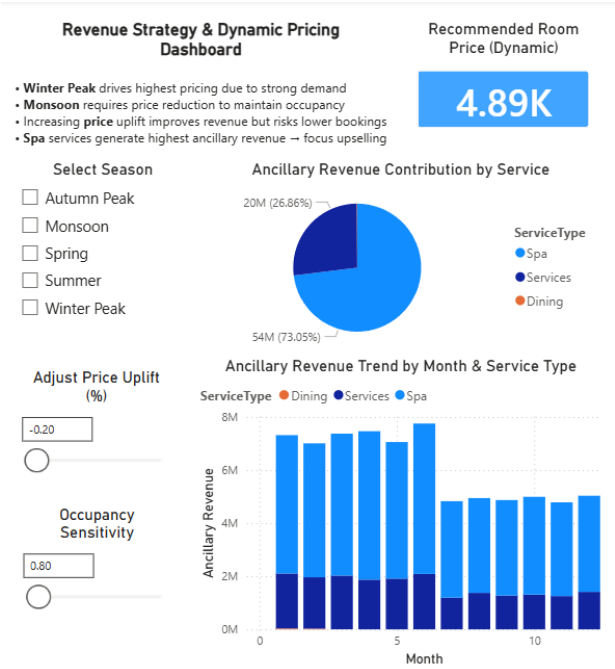
- **Slicers**

  Slicers were added for Season, Price Uplift (%), and Occupancy Sensitivity to enable interactive filtering and dynamic analysis.

KEY INSIGHTS

The dashboard provides the following insights:

- Winter Peak season results in higher recommended prices due to increased demand.
- Monsoon season requires lower pricing to maintain occupancy.
- Increasing price uplift improves revenue potential but may impact booking volume.
- Spa services contribute the highest share of ancillary revenue, indicating strong upselling opportunities.



Dynamic Pricing by Room Type & Season

RoomType	Autumn Peak	Monsoon	Spring	Summer	Winter Peak	Total
Accessible Room	2,048.00	1,792.00	2,176.00	1,920.00	2,432.00	2,048.00

CONCLUSION

- This module demonstrates how dynamic pricing strategies can be implemented using Power BI. By integrating user-controlled parameters and demand-based adjustments, the dashboard enables flexible and data-driven pricing decisions.
- The combination of pricing logic and revenue analysis enhances overall revenue optimization.
