MODULE 1

From module 1, I have done with creating 5 tables named :

Customer

Branch

Date

Booking

Rooms

Therefore in that, created calculated columns like Stay Type, Branch Name and many more.

The below table named Customer contains 4000*22 rows & columns.

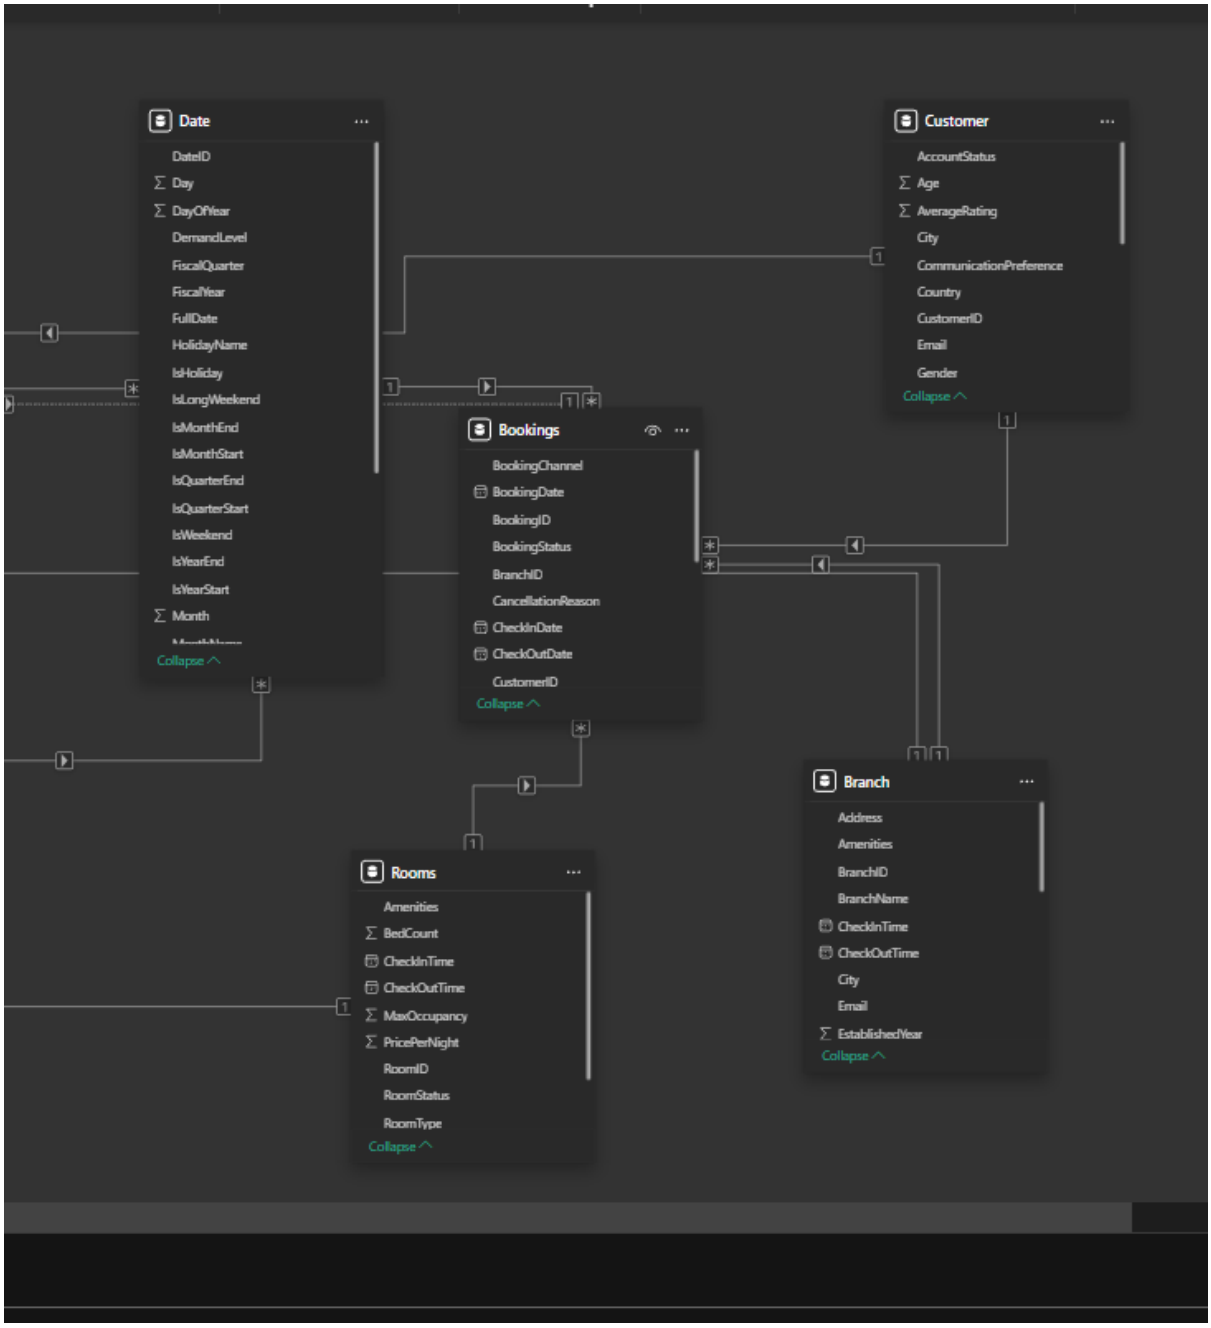
After that, loaded all the tables in POWER BI using get data option and created a relationship between all the tables. In particular, created a STAR schema. A STAR schema is a data modelling approach that organizes data into a central Fact table (which containing qualitative/numeric values) surrounded by dimension tables (containing descriptive attributes). It is used to maximize performance. And then created relationships.



Therefore from Module 1, I generated the data and handled in excel by applying various data cleaning techniques. Ex. Changing data type. And then loaded in POWER BI also used transform data option to correct or upgrade anything.

MODULE 2.

In module 2 I created duration details table.

Duration details contains 25000*7 rows & columns.
